

Hi,

Here are some information that may be useful:

the computer is an Asus VivoBook S512FA-EJ726T
it has an Intel Corporation Cannon Point-LP CNVi [Wireless-AC]

it doesn't have its own Ethernet input,
we use YOSH adaptor USB C to Gigabit Ethernet, USB 3.1 to RJ45 Ethernet, 10/100/1000Mbps,
smart chip RTL 8153

Currently, with kernel-desktop-5.4.6-1.mga7-1-1.mga7.x86_64.rpm (with firmware 20191220), wifi
doesn't work, but if I plug the Ethernet adaptor, I have access to the internet.
I always unplug this adaptor during tests. I use a USB stick to transfer files from another computer
connected to the internet.

Figure 2: Screenshot with Ethernet adaptor unplugged

Moreover, the line “Sans fil (Wi-Fi)” is blinking.

At the beginning, before I started to solve the problem, I had the following notification displayed:
